

Instructions for the preparation and injection of the medication:

1. Take the syringe and attach a 23 G (green) needle.
2. Fill the syringe with 0.5 ml of bacteriostatic water.
3. Allow the powder to dissolve completely, which will take about 2-3 minutes.
4. Draw the liquid back into the syringe.
5. Switch to a 27 G (gray) needle and remove any air from the syringe.
6. Clean the chosen injection site (the abdomen around the navel is most recommended; otherwise, the thigh or shoulder).
7. Gently pinch the skin and insert the needle into the chosen site. Press gently until all the product is injected.
8. Clean the injection site with a wipe.
9. Change the injection site each week, following a clock-face pattern.

Note: Do not grocery shop before the treatment, as your appetite may be reduced.
